performance properties, the trends in material developments, and their application in automotive, electrical and electronics, industrial, consumer products and other markets, including medical.

This report reviews and compares the properties of the four categories of materials which fall within the subject area: polyarylethers and thioethers; polyimides and polybenzimidazole; fluoropolymers; and thermotropic liquid crystalline polymers. The report is completed by an indexed section containing more than 400 references and abstracts selected from the Rapra Polymer Library database.

Polymers are used in everything from nylon stockings to commercial aircraft to artificial heart valves, and they have a key role in addressing international competitiveness and other national issues. Polymer Science and Engineering explores the universe of polymers, describing their properties and wide-ranging potential, and presents the state of the science, with a hard look at downward trends in research support. Leading experts offer findings, recommendations, and research directions. Lively vignettes provide snapshots of polymers in everyday applications. The volume includes an overview of the use of polymers in such fields as medicine and biotechnology, information and communication, housing and construction, energy and transportation, national defense, and environmental protection. The committee looks at the various classes of polymers--plastics, fibers, composites, and other materials, as well as polymers used as membranes and coatings--and how their composition and specific methods of processing result in unparalleled usefulness. The reader can also learn the science behind the technology, including efforts to model polymer synthesis after nature's methods, and breakthroughs in characterizing polymer properties needed for twenty-first-century applications. This informative volume will be important to chemists, engineers, materials scientists, researchers, industrialists, and policymakers interested in the role of polymers, as well as to science and engineering educators and students.

High-Performance Polymers for Engineering-Based Composites presents a selection of investigations and innovative research in polymer chemistry and advanced materials. The book includes case studies in the field of nanocomposites. The volume provides coverage of new research in polymer science and engineering with applications in chemical engineering, materials science, and chemistry. In addition to synthetic polymer chemistry, it also looks at the properties of polymers in various states (solution, melt, solid). The chapters provide a survey of the important categories of polymers including commodity thermoplastics and fibers, elastomers and thermosets, and engineering and specialty polymers. Basic polymer processing principles are explained as well as in-depth descriptions of the latest polymer applications in different industrial sectors. This new book reviews the field's current state and emerging advances. With contributions from experts from both the industry and academia, this book presents the latest developments in polymer products and chemical processes.

Since the mid-1970s, pressure from international competition has forced business in the United States to look for better ways to achieve and maintain a competitive position. One popular tool is the self-managed work-team (SMWT). This book provides a thorough examination of SMWT both at the level of theory and at the practical level of when to use work teams to find solutions and how to develop successful teams. By examining the most widely accepted theories of work-team performance, illustrated by 10 case studies from the areas of manufacturing, public service and health care, the authors define: how high-performing self-managed work teams differ from work groups and short-term teams; the problems which compel an organizati
