This book uses modern biological knowledge to tackle the question of what distinguishes living organisms from the non-living world. The authors first draw on recent advances in cell and molecular biology to develop an account of the living state that applies to all organisms (and only to organisms). This account is then used to explore questions about evolution, the origin of life, and the possibility

of extraterrestrial life. The novel approach taken by this book to issues in biology will interest and be accessible to both the general reader as well as students and specialists in the field.

In a comprehensive study of early Islamic history, Wilferd Madelung examines the conflict which developed after Muhammad's death for the leadership of the Muslim community. He pursues the history of this conflict through the reign of the four 'Rightly Guided' caliphs to its climax in the first inter-Muslim war. The outcome of the war, which marked the demise of the reign of the Early Companions, resulted in the lasting schism between Sunnite and Shi'ite Islam. Contrary to recent scholarly trends, the author brings out 'Ali's early claim to legitimate succession, which gained support from the Shi'a, and offers a convincing reinterpretation of early Islamic history. This book will make a major contribution to the debate over succession. Wilferd Madelung's book *The Succession to Muhammad* has been awarded the Best Book of the Year prize by the Islamic Republic of Iran for the year 1997.

Old and New Fields of Old-Field Ecology In ecology, succession occupies a place similar to that of evolution in general biology. Ram6n Margalef, 1968. It was a great honor for me to have been asked by Marinus Werger to write an introductory note to this very special volume. Presumably my friends and former students in Europe felt that a few words from the *New World* might put the results presented in this exciting book into a somewhat broader perspective. My perspective (or retrospective), however, is neither impersonal nor original; it is an eclectic reflection of recent developments in ecology and in old-field ecology in particular. The ecological generalizations and theories of Ram6n Margalef and Eugene P. Odum, as we perceived them in Prague in the early 1970s, were for some of us so attractive and promising that we even started to believe it would not take too long until we had a truly unifying general theory of ecological succession. All that was needed - we thought - were data clarifying a few controversial issues. This is how our studies of old-field succession began in 1973. We viewed old-fields as a sort of 'Drosophila' for terrestrial ecology.
