WHY THE WEST RULES. The West rules because of geography. Biology tells us why humans push social development upward; sociology tells us how they do this (except when they don't); and geography tells us why the West, rather than some other region, has for the last two hundred years dominated the globe.

50,000 years of history, archeology, and the methods of social science, to make sense of when, how, and why the paths of development differed in the East and West — and what this portends for the 21st century. There are two broad schools of thought on why the West rules. Proponents of "Long-Term Lock-In" theories such as Jared Diamond suggest that from time immemorial, some critical factor — geography, climate, or culture perhaps — made East and West unalterably different, and determined that the industrial revolution would happen in the West and push it further ahead of the East. But the East led the West between 500 and 1600, so this development can't have been inevitable; and so proponents of "Short-Term Accident" theories argue that Western rule was a temporary aberration that is now coming to an end, with Japan, China, and India resuming their rightful places on the world stage. However, as the West led for 9,000 of the previous 10,000 years, it wasn't just a temporary aberration. So, if we want to know why the West rules, we need a whole new theory. Ian Morris, boldly entering the turf of Jared Diamond and Niall Ferguson, provides the broader approach that is necessary, combining the textual historian's focus on context, the anthropological archaeologist's awareness of the deep past, and the social scientist's comparative methods to make sense of the past, present, and future — in a way no one has ever done before.

Why did British boats shoot their way up the Yangzi in 1842, rather than Chinese ones up the Thames? Why do Easterners use English more than Europeans speak in Mandarin or Japanese? To put it bluntly, why does the West rule? There are two schools of thought: the 'Long-Term Lock In' theory, suggesting some sort of inevitability, and the 'Short-Term Accident' theory. But both approaches have misunderstood the shape of history. Ian Morris presents a startling new theory. He explains with flair and authority why the paths of development differed in the East and West and - analysing a vicious twist in trajectories just ahead of us - predicts

A New York Times Notable Book for 2011 Sometime around 1750, English entrepreneurs unleashed the astounding energies of steam and coal, and the world was forever changed. The emergence of factories, railroads, and gunboats propelled the West's rise to power in the nineteenth century, and the development of computers and nuclear weapons in the twentieth century secured its global supremacy. Now, at the beginning of the twenty-first century, many worry that the emerging economic power of China and India spells the end of the West as a superpower. In order to understand this possibility, we need to look back in time. Why has the West dominated the globe for the past two hundred years, and will its power last? Describing the patterns of human history, the archaeologist and historian Ian Morris offers surprising new answers to both questions. It is not, he reveals, differences of race or culture, or even the strivings of great individuals, that explain Western dominance. It is the effects of geography on the everyday efforts of ordinary people as they deal with crises of resources, disease, migration, and climate. As geography and human ingenuity continue to interact, the world will change in astonishing ways, transforming Western rule in the process. Uses four factors--energy capture per capita, organization, information technology and war-making capacity--to attempt to show which world regions were the most powerful throughout all of human history.

Examining how war has positively changed our society, a renowned historian and archaeologist tells the riveting story of 15,000 years of war, going beyond the battles and brutality to reveal what war has really done to and for the world. 50,000 first printing.

Most people in the world today think democracy and gender equality are good, and that violence and wealth inequality are bad. But most people who lived during the 10,000 years before the nineteenth century thought just the opposite. Drawing on archaeology, anthropology, biology, and history, Ian Morris explains why. Fundamental long-term changes in values, Morris argues, are driven by the most basic force of all: energy. Humans have found three main ways to get the energy they need—from foraging, farming, and fossil fuels. Each energy source sets strict limits on what kinds of societies can succeed, and each kind of society rewards specific values. But if our fossil-fuel world favors democratic, open societies, the ongoing revolution in energy capture means that our most cherished values are very likely to turn out not to be useful any more. Foragers, Farmers, and Fossil Fuels offers a compelling new argument about the evolution of human values, one that has far-reaching implications for how we understand the past—and for what might happen next. Originating as the Tanner Lectures delivered at Princeton University, the book includes challenging responses by classicist Richard Seaford, historian of China Jonathan Spence, philosopher Christine Korsgaard, and novelist Margaret Atwood.

From the bestselling author of *The Ascent of Money* and *The Square and the Tower* Western civilization's rise to global dominance is the single most important historical phenomenon of the past five centuries. How did the West overtake its Eastern rivals? And has the zenith of Western power now passed? Acclaimed historian Niall Ferguson argues that beginning in the fifteenth century, the West developed six powerful new concepts, or "killer applications"—competition, science, the rule of law, modern medicine, consumerism, and the work ethic—that the Rest lacked, allowing it to surge past all other competitors. Yet now, Ferguson shows how the Rest have downloaded the killer apps the West once monopolized, while the West has literally lost faith in itself. Chronicling the rise and fall of empires alongside clashes (and fusions) of civilizations, *Civilization: The West and the Rest* recasts world history with force and wit. Boldly argued and teeming with memorable characters, this is Ferguson at his very best.

individualistic, self-obsessed, control-oriented, nonconformist, and analytical. They focus on themselves—their attributes, accomplishments, and aspirations—over their relationships and social roles. How did WEIRD populations become so psychologically distinct? What role did these psychological differences play in the industrial revolution and the global expansion of Europe during the last few centuries? In *The WEIRDest People in the World*, Joseph Henrich draws on cutting-edge research in anthropology, psychology, economics, and evolutionary biology to explore these questions and more. He illuminates the origins and evolution of family structures, marriage, and religion, and the profound impact these cultural transformations had on human psychology. Mapping these shifts through ancient history and late antiquity, Henrich reveals that the most fundamental institutions of kinship and marriage changed dramatically under pressure from the Roman Catholic Church. It was these changes that gave rise to the WEIRD psychology that would coevolve with impersonal markets, occupational specialization, and free competition—laying the foundation for the modern world. Provocative and engaging in both its broad scope and its surprising details, *The WEIRDest People in the World* explores how culture, institutions, and psychology shape one another, and explains what this means for both our most personal sense of who we are as individuals and also the large-scale social, political, and economic forces that drive human history. Includes black-and-white illustrations.

The world's first known empires took shape in Mesopotamia between the eastern shores of the Mediterranean Sea and the Persian Gulf, beginning around 2350 BCE. The next 2,500 years witnessed sustained imperial growth, bringing a growing share of humanity under the control of ever-fewer states. Two thousand years ago, just four major powers--the Roman, Parthian, Kushan, and Han empires--ruled perhaps two-thirds of the earth's entire population.

Yet despite empires' prominence in the early history of civilization, there have been surprisingly few attempts to study the dynamics of ancient empires in the western Old World comparatively. Such grand comparisons were popular in the eighteenth century, but scholars then had only Greek and Latin literature and the Hebrew Bible as evidence, and necessarily framed the problem in different, more limited, terms. Near Eastern texts, and knowledge of their languages, only appeared in large amounts in the later nineteenth century. Neither Karl Marx nor Max Weber could make much use of this material, and not until the 1920s were there enough archaeological data to make syntheses of early European and west Asian history possible. But one consequence of the increase in empirical knowledge was that twentieth-century scholars generally defined the disciplinary and geographical boundaries of their specialties more narrowly than their Enlightenment predecessors had done, shying away from large questions and cross-cultural comparisons. As a result, Greek and Roman empires have largely been studied in isolation from those of the Near East. This volume is designed to address these deficits and encourage dialogue across disciplinary boundaries by examining the fundamental features of the successive and partly overlapping imperial states that dominated much of the Near East and the Mediterranean in the first millennia BCE and CE. A substantial introductory discussion of recent thought on the mechanisms of imperial state formation prefaces the five newly commissioned case studies of the Neo-Assyrian, Achaemenid Persian, Athenian, Roman, and Byzantine empires. A final chapter draws on the findings of evolutionary psychology to improve our understanding of ultimate causation in imperial predation and exploitation in a wide range of historical systems from all over the globe. Contributors include John Haldon, Jack Goldstone, Peter Bedford, Josef Wiesehöfer, Ian Morris, Walter Scheidel, and Keith Hopkins, whose essay on Roman political economy was completed just before his death in 2004.
