of ordinary temperature and low pressure. This is one of the most useful gas laws to know because it can be used to find pressure, volume, number of moles, or temperature of a gas. The formula for the ideal gas law is:  $PV = nRT$ .  $P$  = pressure.

The ideal gas law relates the pressure, volume, quantity, and temperature of an ideal gas. At ordinary temperatures, you can use the ideal gas law to approximate the behavior of real gases. Ideal gas molecules themselves take up no volume. The gas takes up volume since the molecules expand into a large region of space, but the Ideal gas molecules are approximated as point particles that have no volume in and of themselves. If this sounds too ideal to be true, you're right.

The Ideal Gas Law was first written in 1834 by Emil Clapeyron. What follows is just one way to "derive" the Ideal Gas Law. For a static sample of gas, we can write each of the six gas laws as follows:  
 $PV = k_1$   
 $V / T = k_2$   
 $P / T = k_3$   
 $V / n = k_4$   
 $P / n = k_5$   
 $1 / nT = 1 / k_6$ . Note that the last law is written in reciprocal form.
