## **Java - Introduction to Object Oriented Programming [OOP Programming**

OOPs, concepts in Java are the main ideas behind Java's Object-Oriented Programming. They are Abstraction, Encapsulation, Inheritance, and Polymorphism.

Grasping them is key to understanding how Java works. Basically, Java OOPs concept lets

of object-oriented programming. Object-oriented programming is a programming paradigm where everything is represented as an object. Objects pass messages to each other. Each object decides what to do with a received message.

Object-Oriented Programming Languages. Object-oriented programming (OOP) languages are designed to overcome these problems. The basic unit of OOP is a class, which encapsulates both the static properties and dynamic operations within a "box", and specifies the public interface for using these boxes. Since

All object-oriented languages have some way to store data about the object. In Java and Python, data is stored in attributes, which are variables associated with specific objects. One of the most significant differences between Python vs Java is how they define and manage class and object attributes.
