You will find out that some materials are elastic, which means that they store energy

when a force is applied to change their shape.

Elastic materials release stored energy

when that force is removed. Stored

energy is called potential energy, which becomes kinetic

energy when an elastic material starts to

move. Related Topics: physics, energy.

An object gets kinetic energy from its mass and velocity. An object with kinetic energy has energy stored in motion. When the object slows down the energy is released into potential energy (if going up) or some other kind of energy (like heat [thermal energy] in the brakes of car). More mass = more Ek More Ek

Potential energy is converted into kinetic energy. The following animation shows the relationship between potential and kinetic energy. Use the step feature to move the roller coaster from one location to the other. Pay close attention to the graph showing the amount of potential and kinetic energy. Swiffy output.
